CHAPTER 3

STACKS AND QUEUES

All the programs in this file are selected from

Ellis Horowitz, Sartaj Sahni, and Susan Anderson-Freed
"Fundamentals of Data Structures in C",

Stack: a Last-In-First-Out (LIFO) list

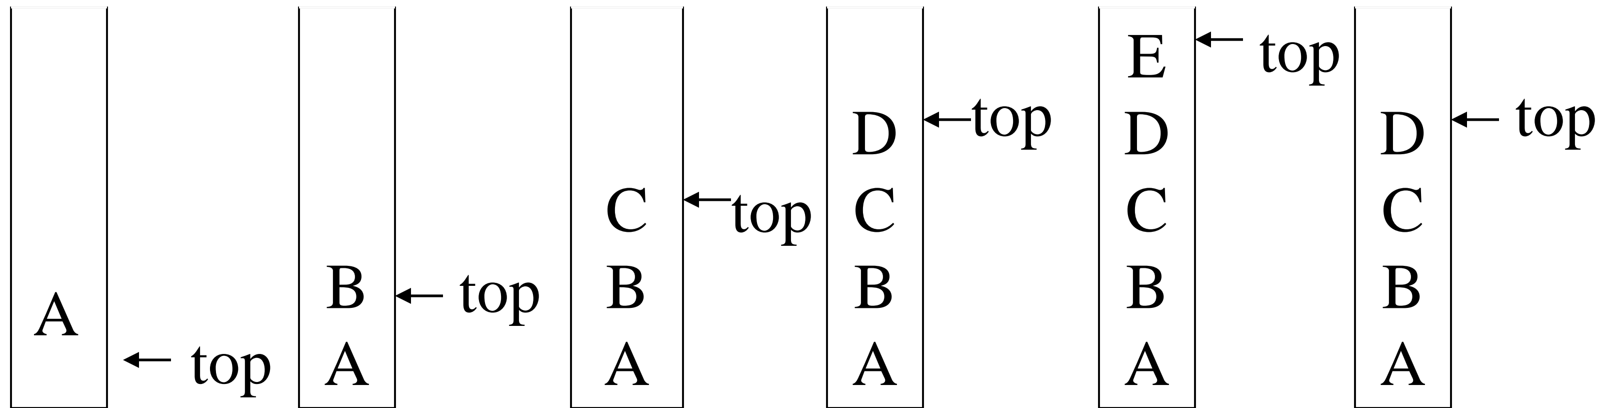

Figure 3.1: Inserting and deleting elements in a stack

An application of stack: stack frame of function call

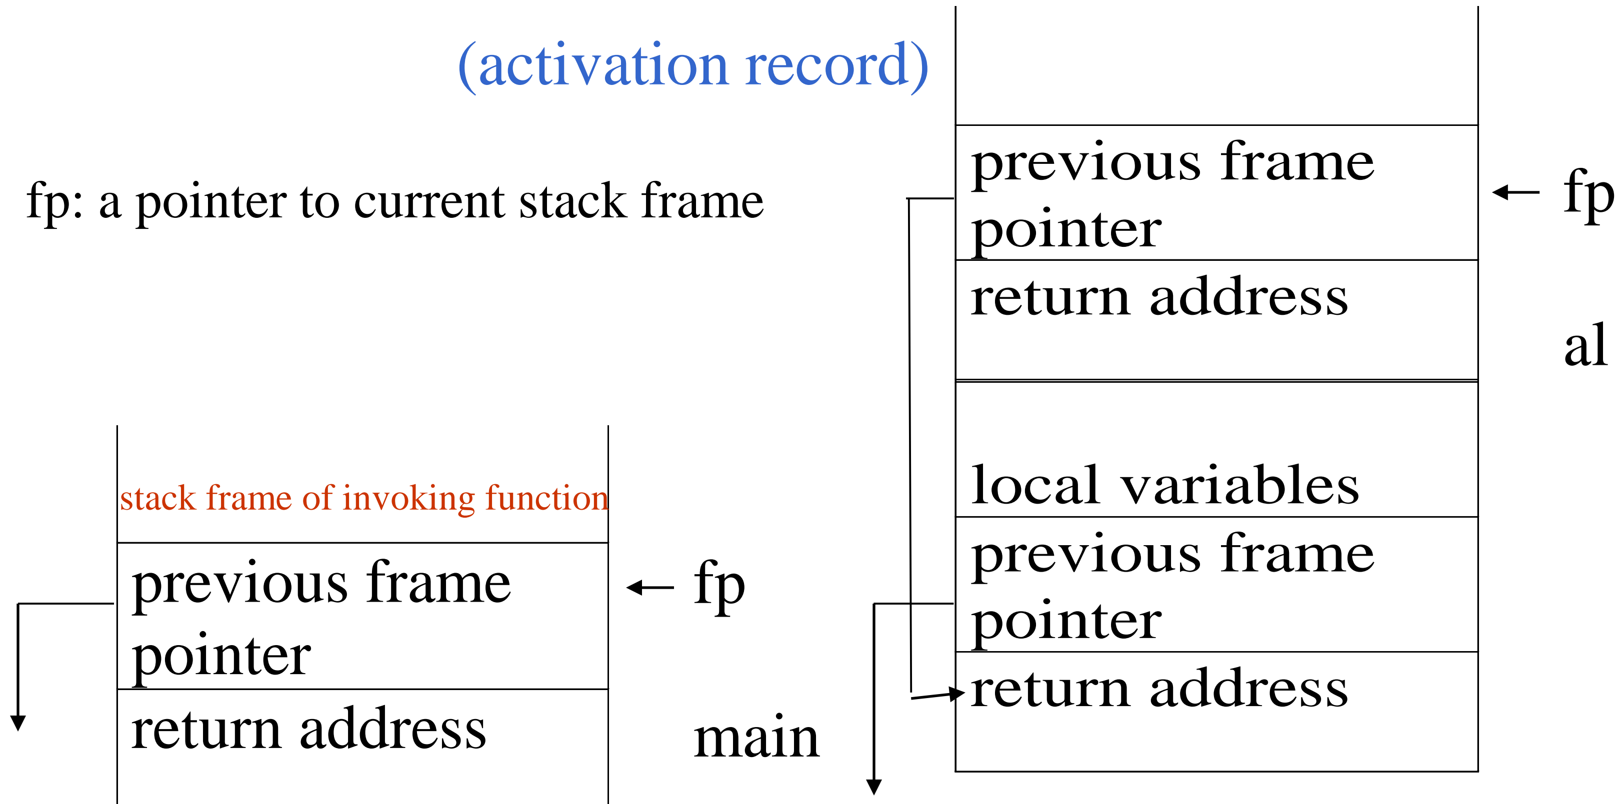

Figure 3.2: System stack after function call a1

abstract data type for stack

structure *Stack* is

objects: a finite ordered list with zero or more elements.

functions:

for all *stack* ∈ *Stack*, *item* ∈ *element*, *max_stack_size* ∈ positive integer

Stack CreateS(*max_stack_size*) ::=
create an empty stack whose maximum size is *max_stack_size*

Boolean IsFull(*stack*, *max_stack_size*) ::=
if (number of elements in *stack* == *max_stack_size*)
return TRUE
else return FALSE

Stack Add(*stack*, *item*) ::=
if (IsFull(*stack*)) *stack_full*
else insert *item* into top of *stack* and **return**

Boolean IsEmpty(*stack*) ::=

if(*stack* == CreateS(*max_stack_size*))
return TRUE
else return FALSE

Element Delete(*stack*) ::=

if(IsEmpty(*stack*)) **return**
else remove and return the *item* on the top
of the stack.

Structure 3.1: Abstract data type *Stack*

Implementation: using array

Stack **CreateS(max_stack_size)** ::=

```
#define MAX_STACK_SIZE 100 /* maximum stack size */
typedef struct {
            int key;
            /* other fields */
            } element;
element stack[MAX_STACK_SIZE];
int top = -1;
```

Boolean **IsEmpty(Stack)** ::= top< 0;

Boolean **IsFull(Stack)** ::= top >= MAX_STACK_SIZE-1;

Add to a stack

```
void push(int *top, element item)
{
 /* add an item to the global stack */
    if (*top >= MAX_STACK_SIZE-1)  {
        stack_full( );
        return;
    }
    stack[++*top] = item;
}
```

Program 3.1: Add to a stack

Delete from a stack

```
element pop(int *top)
{
 /* return the top element from the stack */
    if (*top == -1)
        return stack_empty( );  /* returns and error key */
    return stack[(*top)--];
 }
```

Program 3.2: Delete from a stack

Queue: a First-In-First-Out (FIFO) list

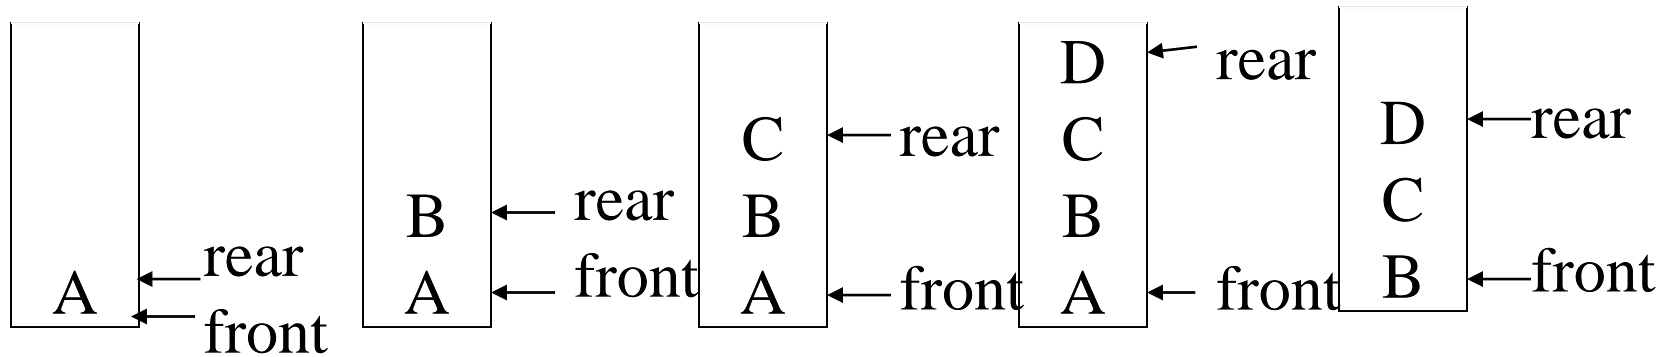

Figure 3.4: Inserting and deleting elements in a queue

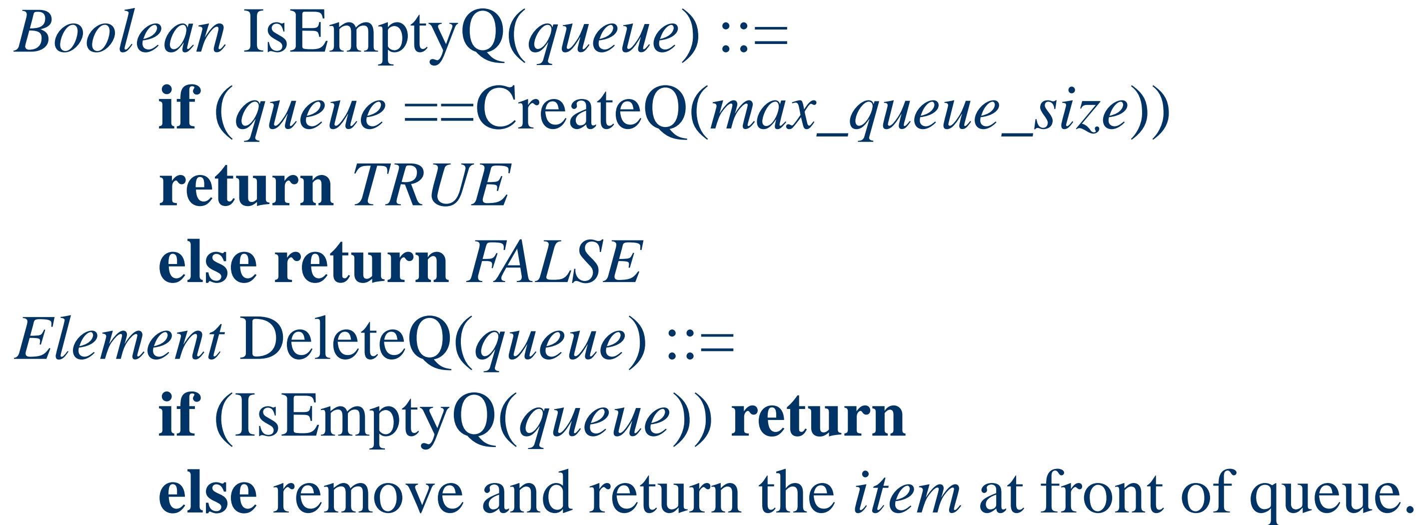
Application: Job scheduling

front	rear	Q[0]	Q[1]	Q[2]	Q[3]	Comments
-1	-1					queue is empty
-1	0	J1				Job 1 is added
-1	1	J1	J2			Job 2 is added
-1	2	J1	J2	J3		Job 3 is added
0	2		J2	J3		Job 1 is deleted
1	2			J3		Job 2 is deleted

Figure 3.5: Insertion and deletion from a sequential queue

Abstract data type of queue

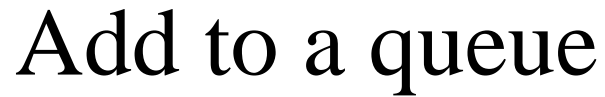
structure *Queue* is
objects: a finite ordered list with zero or more elements.
functions:
for all *queue* ∈ *Queue*, *item* ∈ *element*,
max_ queue_ size ∈ positive integer
Queue CreateQ(*max_queue_size*) ::=
create an empty queue whose maximum size is
max_queue_size
Boolean IsFullQ(*queue*, *max_queue_size*) ::=
if(number of elements in *queue* == *max_queue_size*)
return *TRUE*
else return *FALSE*
Queue AddQ(*queue*, *item*) ::=
if (IsFullQ(*queue*)) *queue_full*
else insert *item* at rear of *queue* and return *queue*



Structure 3.2: Abstract data type *Queue*

Implementation 1: **using array**

```
Queue CreateQ(max_queue_size) ::=
# define MAX_QUEUE_SIZE 100/* Maximum queue size */
typedef struct {
                int key;
                /* other fields */
                } element;
element queue[MAX_QUEUE_SIZE];
int rear = -1;
int front = -1;
Boolean IsEmpty(queue) ::= front == rear
Boolean IsFullQ(queue) ::= rear == MAX_QUEUE_SIZE-1
```



Add to a queue

```
void addq(int *rear, element item)
{
/* add an item to the queue */
    if (*rear == MAX_QUEUE_SIZE-1) {
        queue_full( );
        return;
    }
   queue [++*rear] = item;
}
```

Program 3.5: Add to a queue

Delete from a queue

```
element deleteq(int *front, int rear)
{
/* remove element at the front of the queue */
    if ( *front == rear)
        return queue_empty( );     /* return an error key */
    return queue [++ *front];
}
```

Program 3.6: Delete from a queue

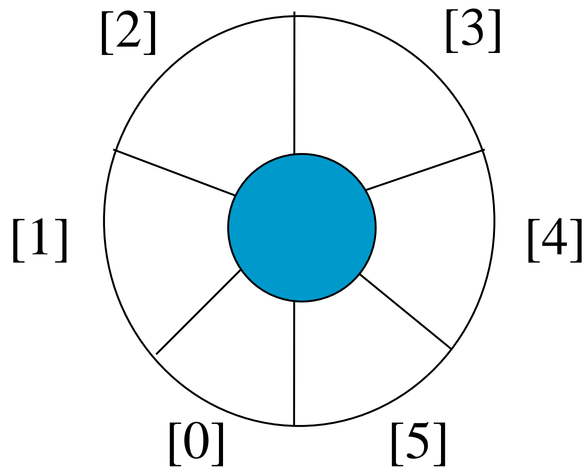
problem: there may be available space when IsFullQ is true i.e., movement is required.

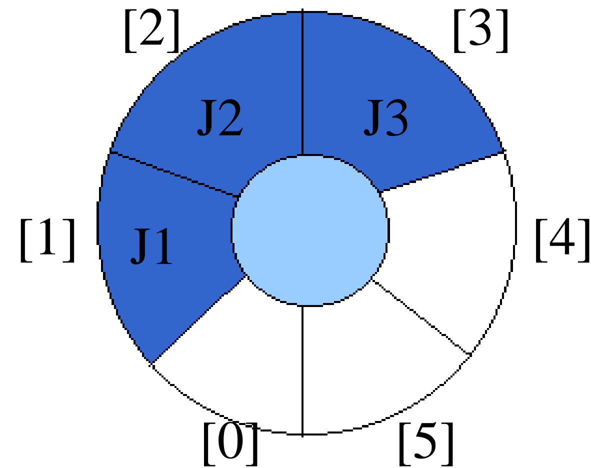
Implementation 2: **regard an array as a circular queue**

front: one position counterclockwise from the first element

rear: current end

EMPTY QUEUE





front = 0
rear = 0

front = 0
rear = 3

Figure 3.6: Empty and nonempty circular queues

Problem: one space is left when queue is full

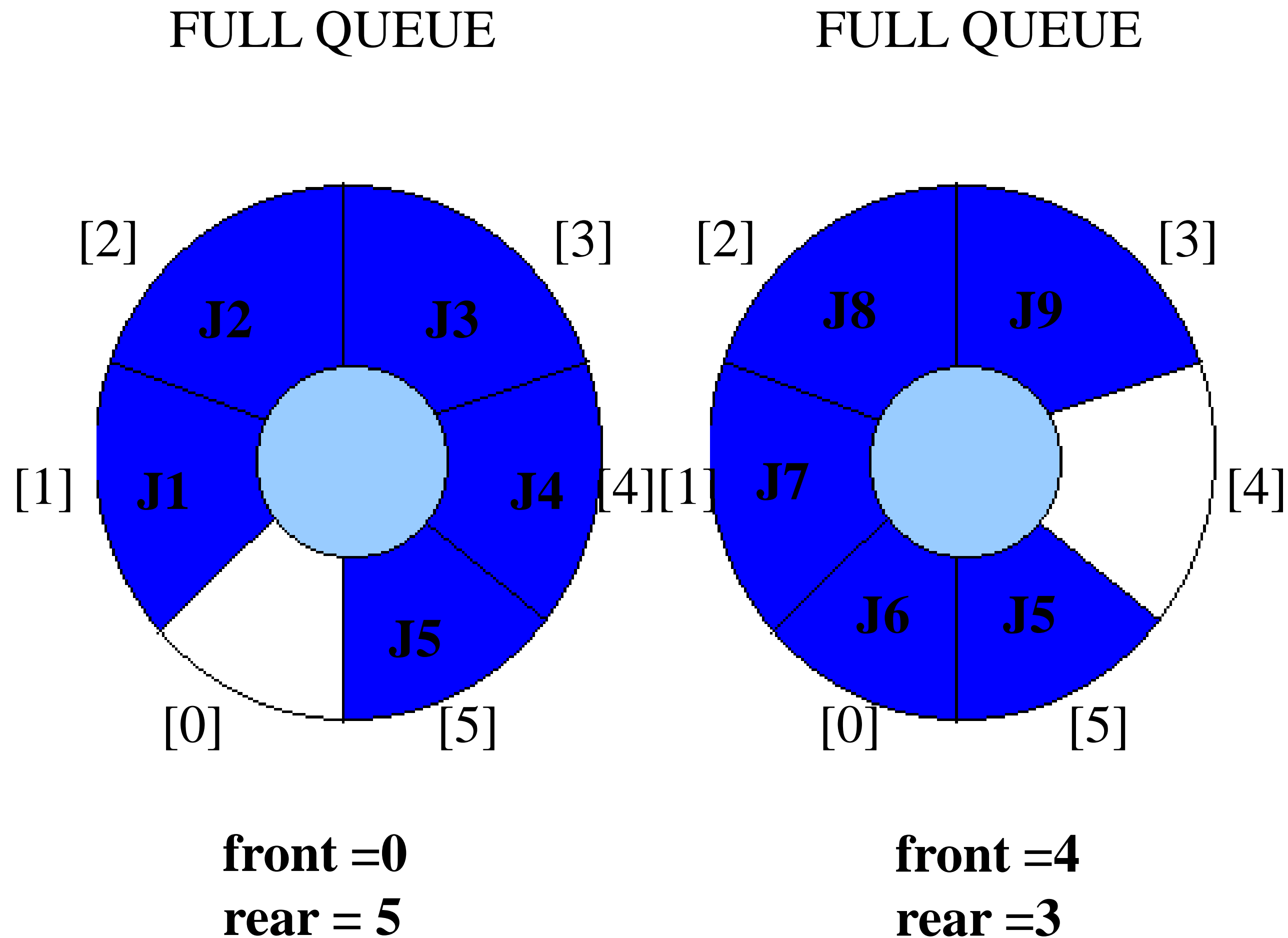


Figure 3.7: Full circular queues and then we remove the item

Add to a circular queue

```
void addq(element item)
{
/* add an item to the queue */
    rear = (rear +1) % MAX_QUEUE_SIZE;
     if (front == rear) /* reset rear and print error */
      queueFull();
    }
     queue[rear] = item;
}
```

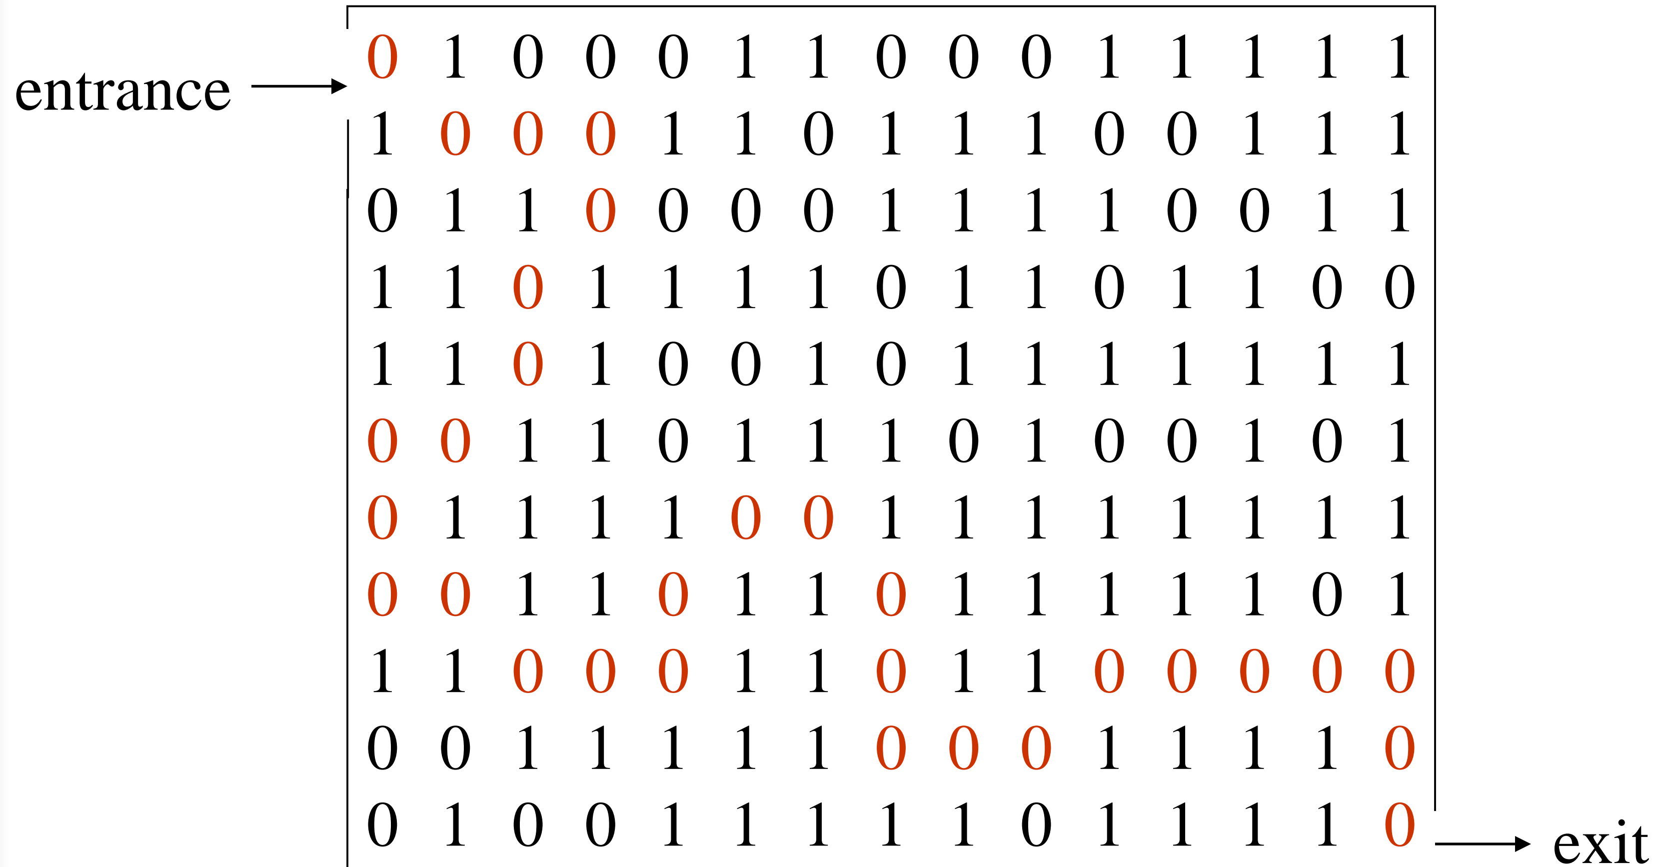
Program 3.7: Add to a circular queue

Delete from a circular queue

```
element deleteq()
{
   element item;
   /* remove front element from the queue and put it in item */
      if (*front == rear)
         return queueEmpty( );
                  /* queue_empty returns an error key */
      front = (front+1) % MAX_QUEUE_SIZE;
      return queue[front];
}
```

Program 3.8: Delete from a circular queue

A Mazing Problem



1: blocked path

0: through path

***Figure 3.8:** An example maze

a possible representation

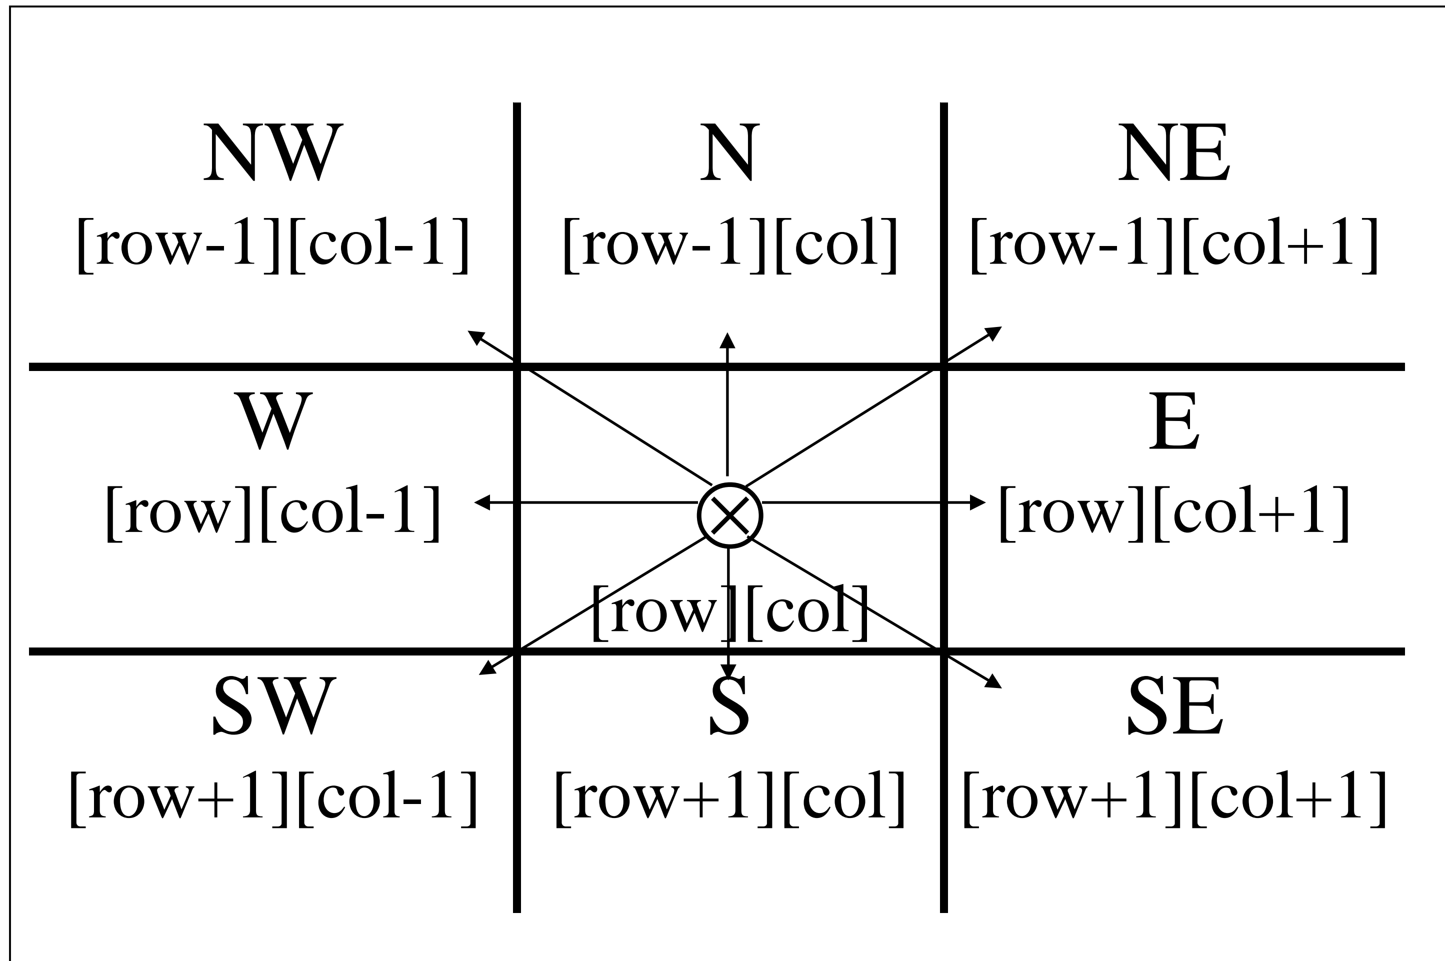


Figure 3.9: Allowable moves

a possible implementation

```
typedef struct {
        short int vert;
        short int horiz;
        } offsets;
offsets move[8]; /*array of moves for each direction*/
```

```
next_row = row + move[dir].vert;
next_col  = col  +  move[dir].horiz;
```

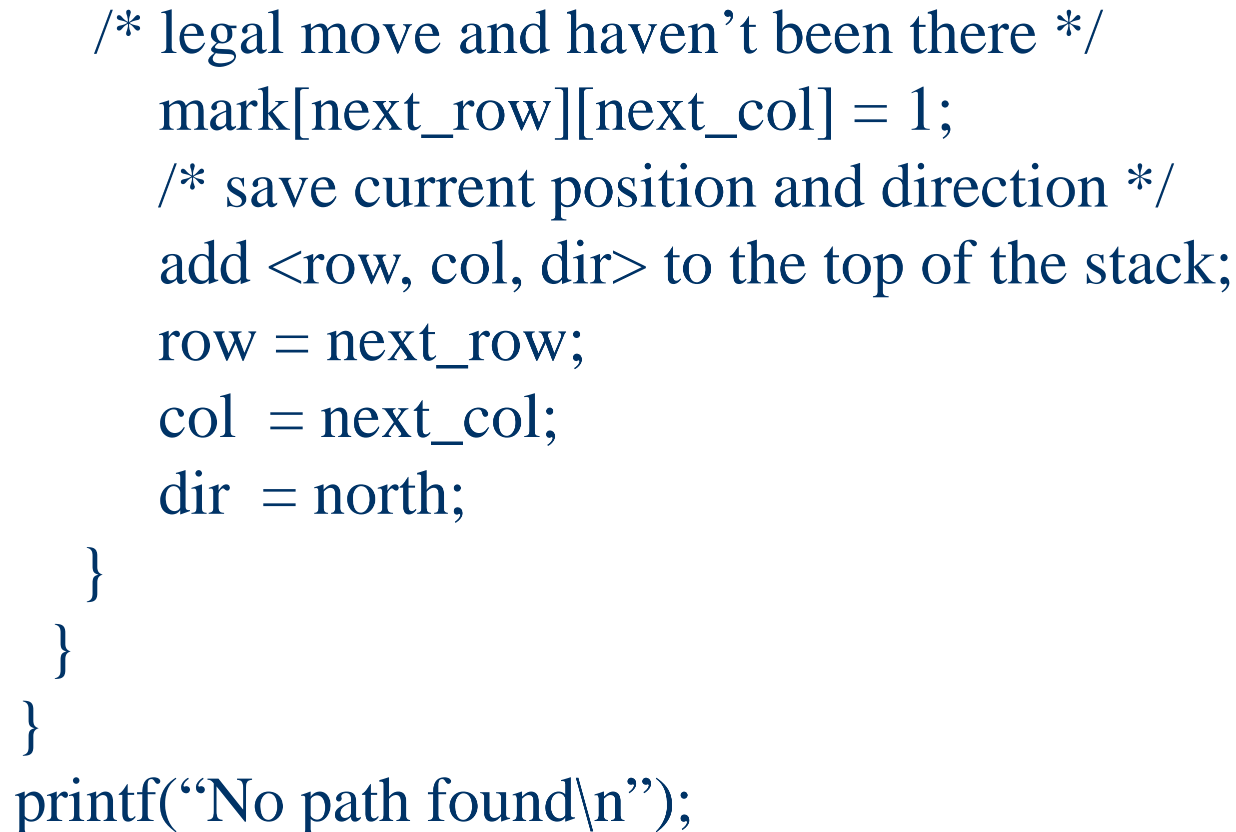
Name	Dir	move[dir].vert	move[dir].horiz
N	0	-1	0
NE	1	-1	1
E	2	0	1
SE	3	1	1
S	4	1	0
SW	5	1	-1
W	6	0	-1
NW	7	-1	-1

Use stack to keep pass history

```
#define MAX_STACK_SIZE 100
          /*maximum stack size*/
typedef struct {
          short int row;
          short int col;
          short int dir;
          } element;
element stack[MAX_STACK_SIZE];
```

Initialize a stack to the maze's entrance coordinates and direction to north;

```
while (stack is not empty){
  /* move to position at top of stack */
<row, col, dir> = delete from top of stack;
while (there are more moves from current position) {
    <next_row, next_col > = coordinates of next move;
    dir = direction of move;
    if ((next_row == EXIT_ROW)&& (next_col == EXIT_COL))
        success; /* find out the destination */
    if (maze[next_row][next_col] == 0 &&
         mark[next_row][next_col] == 0) {
```



```
    /* legal move and haven't been there */
      mark[next_row][next_col] = 1;
      /* save current position and direction */
      add <row, col, dir> to the top of the stack;
      row = next_row;
      col  = next_col;
      dir  = north;
    }
  }
}
printf("No path found\n");
```

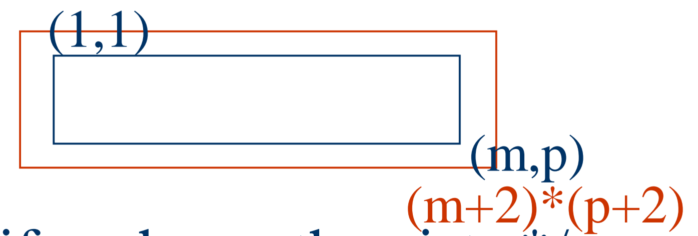
***Program 3.11:** Initial maze algorithm

The size of a stack?

$$\begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 1 & 1 & 1 & 1 & 0 \\ 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 & 0 & 1 \\ 1 & 1 & 1 & 1 & 1 & 0 \\ 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}_{m*p}$$

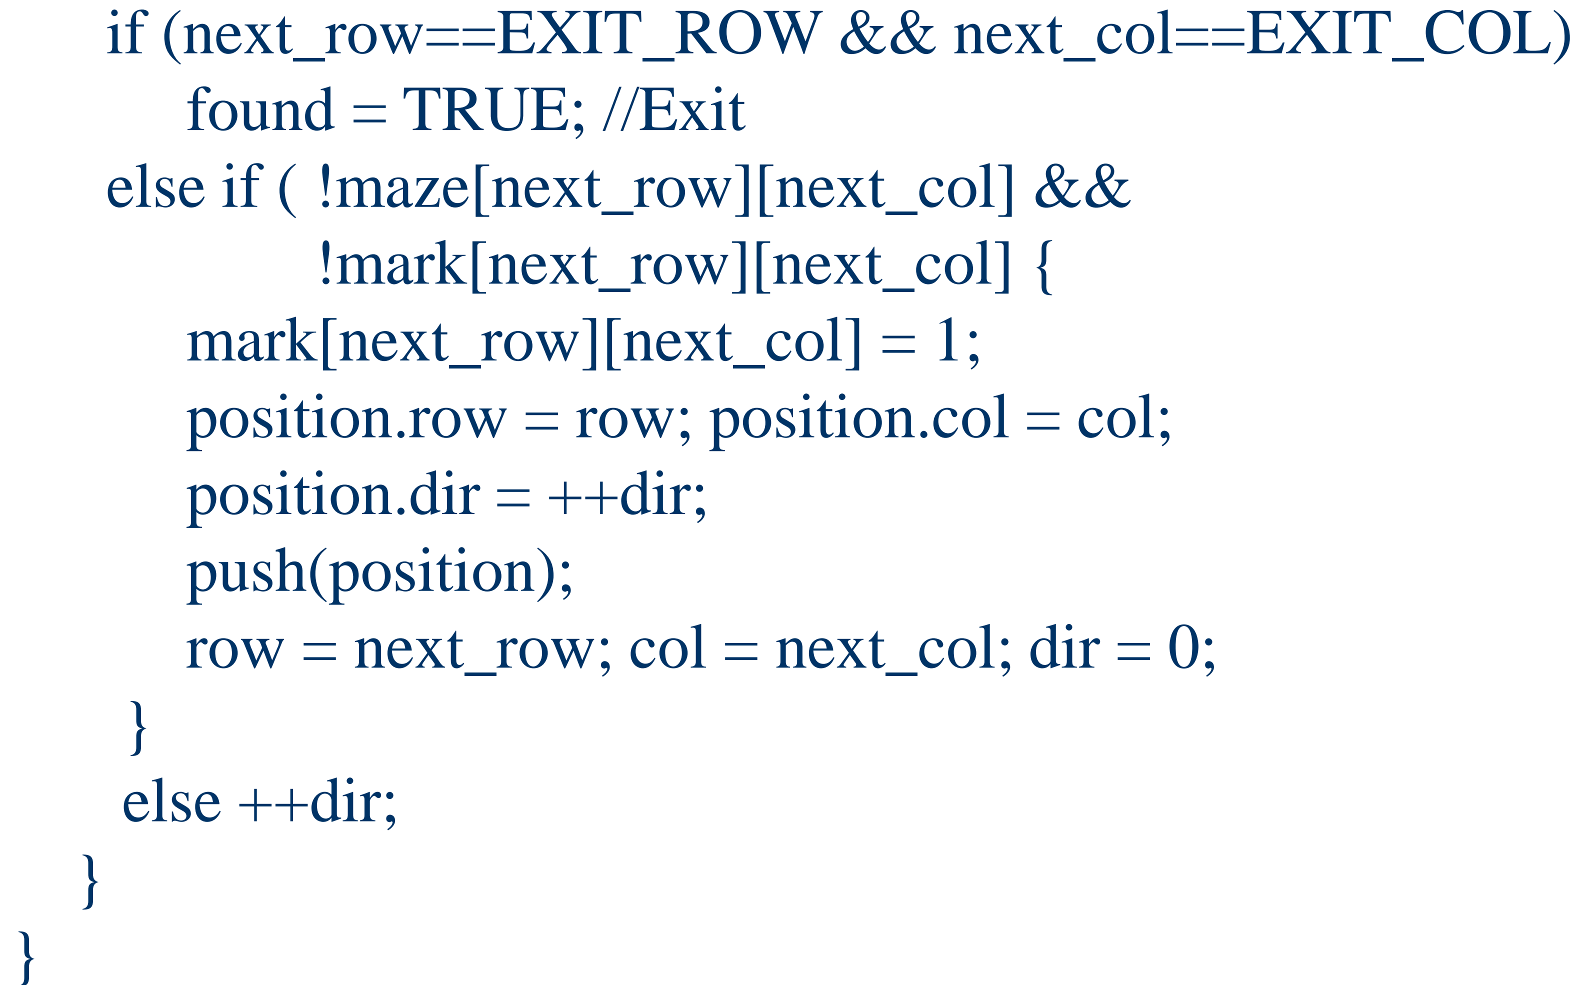
The worst case complexity of the algorithm is O(mp)

Figure 3.11: Simple maze with a long path

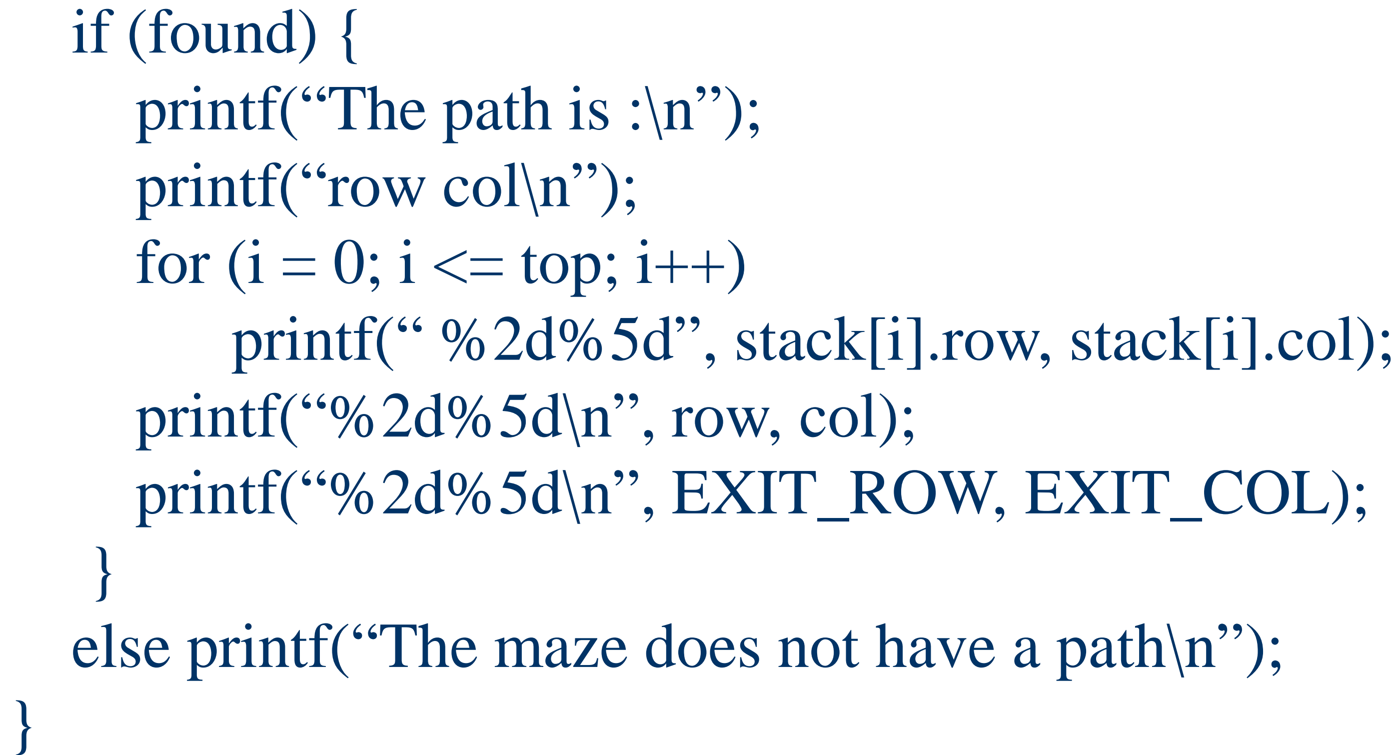


```
void path (void)
{
/* output a path through the  maze if such a path exists */
    int i, row, col, next_row, next_col, dir, found = FALSE;
    element position;
    mark[1][1] = 1; top =0;
    stack[0].row = 1; stack[0].col = 1; stack[0].dir = 1;
    while (top > -1 && !found) {
       position = pop();
       row = position.row; col = position.col;
       dir  = position.dir;
       while (dir < 8 && !found) {
              /*move in direction dir  */
              next_row = row + move[dir].vert;
              next_col  = col + move[dir].horiz;
```

	0	
7	**N**	**1**
6 W		**E 2**
5	**S**	**3**
	4	



```
        if (next_row==EXIT_ROW && next_col==EXIT_COL)
            found = TRUE; //Exit
        else if ( !maze[next_row][next_col] &&
                   !mark[next_row][next_col] {
            mark[next_row][next_col] = 1;
            position.row = row; position.col = col;
            position.dir = ++dir;
            push(position);
            row = next_row; col = next_col; dir = 0;
         }
         else ++dir;
    }
}
```



```
  if (found) {
     printf(“The path is :\n”);
     printf(“row col\n”);
     for (i = 0; i <= top; i++)
          printf(“ %2d%5d”, stack[i].row, stack[i].col);
     printf(“%2d%5d\n”, row, col);
     printf(“%2d%5d\n”, EXIT_ROW, EXIT_COL);
   }
  else printf(“The maze does not have a path\n”);
}
```

Program 3.12: Maze search function

Evaluation of Expressions

X = a / b - c + d * e - a * c

a = 4, b = c = 2, d = e = 3

How to generate the machine instructions corresponding to given expression?

Interpretation 1:

((4/2)-2)+(3*3)-(4*2)=0 + 8+9=1

Interpretation 2:

(4/(2-2+3))*(3-4)*2=(4/3)*(-1)*2=-2.66666…

eos	$*_2$			0	abc+$*_1$d$*_2$

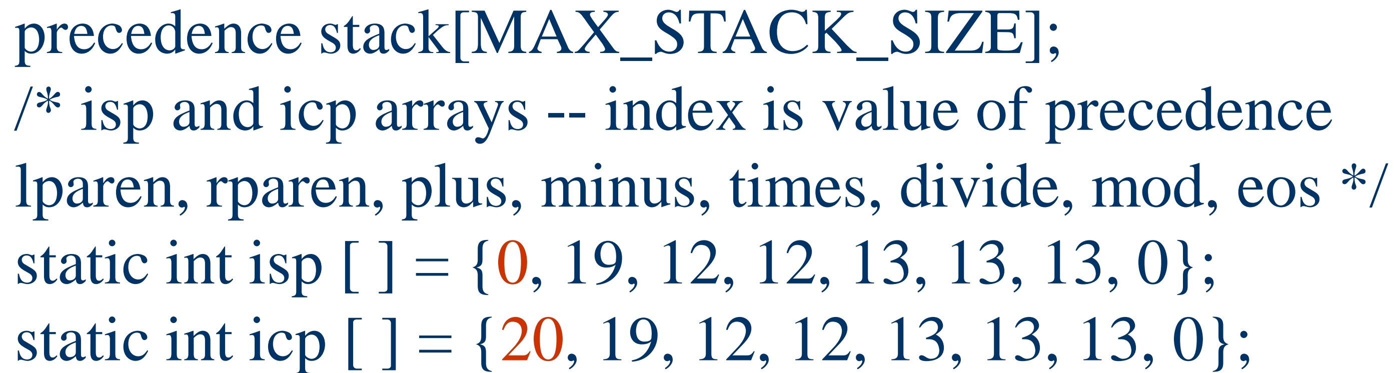
Figure 3.16: Translation of a*(b+c)*d to postfix

Rules

(1) Operators are **taken out** of the stack as long as their in-stack precedence (isp) is **higher than or equal to** the incoming precedence (icp) of the new operator.

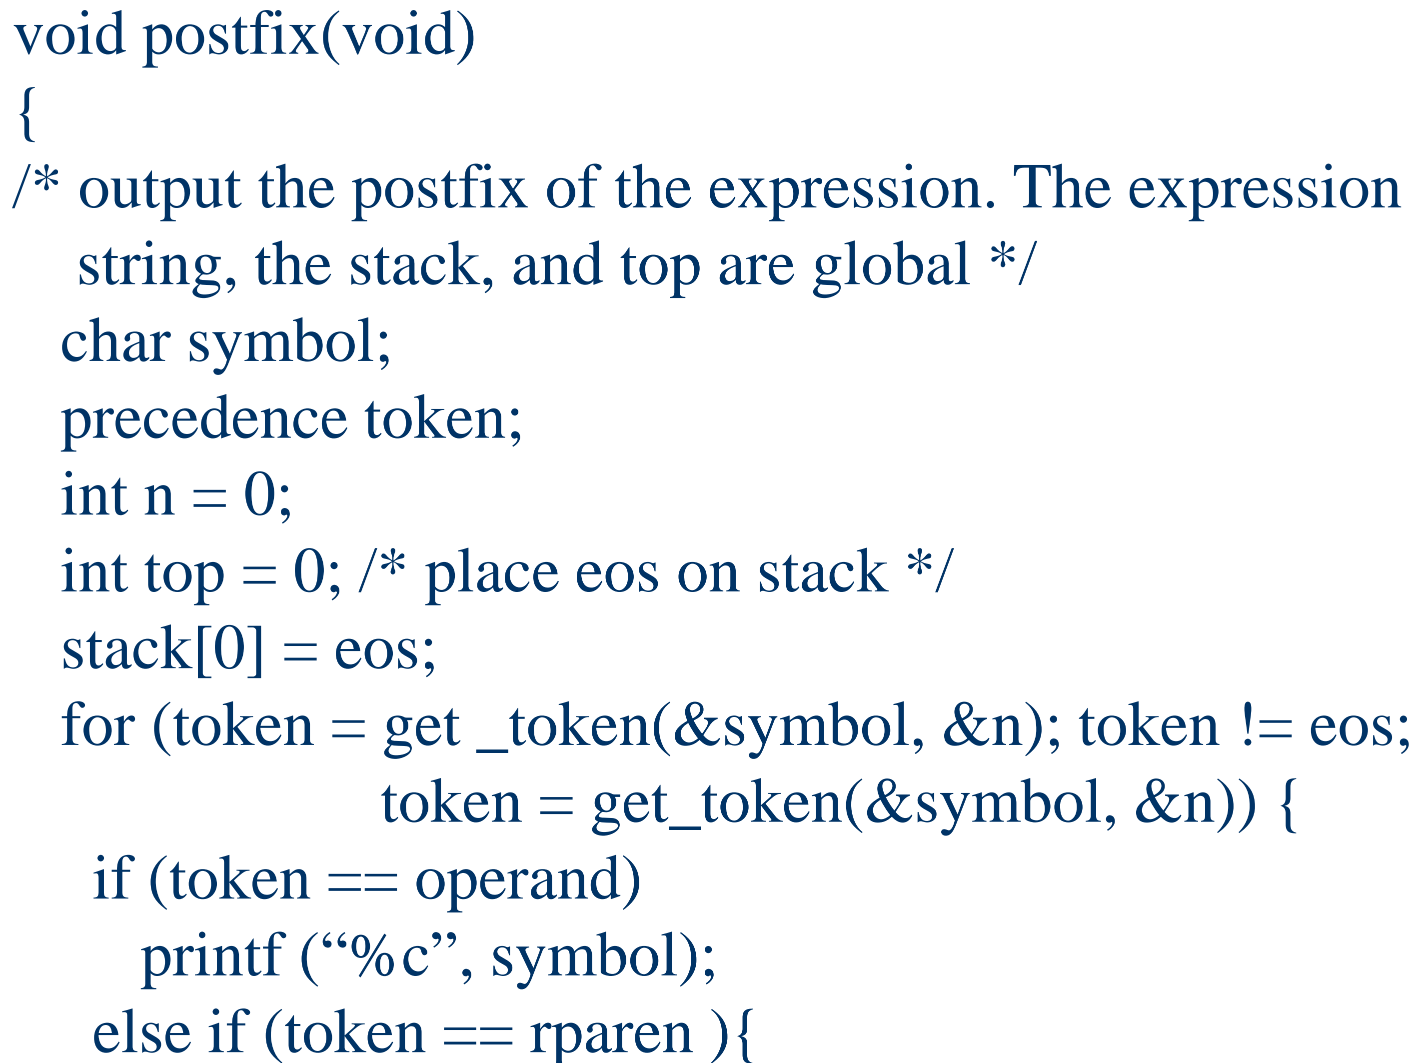
(2) "(" has low in-stack precedence, and high incoming precedence.

	(	)	+	-	*	/	%	eos
isp	0	19	12	12	13	13	13	0
icp	20	19	12	12	13	13	13	0



```
precedence stack[MAX_STACK_SIZE];
/* isp and icp arrays -- index is value of precedence
lparen, rparen, plus, minus, times, divide, mod, eos */
static int isp [ ] = {0, 19, 12, 12, 13, 13, 13, 0};
static int icp [ ] = {20, 19, 12, 12, 13, 13, 13, 0};
```

isp: in-stack precedence
icp: incoming precedence



```
void postfix(void)
{
/* output the postfix of the expression. The expression
    string, the stack, and top are global */
   char symbol;
   precedence token;
   int n = 0;
   int top = 0; /* place eos on stack */
   stack[0] = eos;
   for (token = get _token(&symbol, &n); token != eos;
                        token = get_token(&symbol, &n)) {
     if (token == operand)
        printf ("%c", symbol);
     else if (token == rparen ){
```

```
     /*unstack tokens until left parenthesis */
     while (stack[top] != lparen)
        print_token(pop());
     pop(); /*discard the left parenthesis */
    }
    else{
     /* remove and print symbols whose isp is greater
        than or equal to the current token's icp */
     while(isp[stack[top]] >= icp[token] )
        print_token(delete(&top));
     push(token);
    }
  }
  while ((token = delete(&top)) != eos)
      print_token(token);
  print("\n");
}
```

$\theta(n)$

$f(n)=\theta(g(n))$ iff there exist positive constants c_1, c_2, and n_0 such that $c_1 g(n) \leq f(n) \leq c_2 g(n)$ for all n, $n \geq n_0$.

$f(n)=\theta(g(n))$ iff $g(n)$ is both an upper and lower bound on $f(n)$.
